

I would like to comment on the Broadband over Power Line issue,
ET Docket 03-104.

The HF Spectrum is a valuable resource that should not be trashed
with a greatly increased noise leve.

I use Amateur Radio to talk to friends. I have done so for the past
35 years. I could use my station to provide emergency communications
on HF thru 70 cm from home or mobile.

I think that increasing interference levels above the Part 15 limits
is a radical departure from the FCC's role of protecting
communications channels from unreasonable interference.

Providing Broadband data communications should be done over a coaxial
cable or optical fiber NOT over the power lines!
